

User research Step 6: Analyzing research findings.

Empathy mapping

Covered in this lecture:

- Why you need an empathy map.
- The main use cases for empathy mapping.
- The process of creating an empathy map.
- Tools available for creating an empathy map.

Let's re-cap:

An empathy map is a technique you can use at the beginning of the product development process to get user insights by analyzing what they Say, Think, Do, and Feel.

The main use cases for empathy mapping include:

- 1. To identify user needs directly from the traits we captured in four quadrants or based on the contradictions we noticed between the traits.*
- 2. To come up with new insight or knowledge that will help us formulate a problem statement we need to design a solution.*
- 3. To develop user personas and identify current gaps in user knowledge.*

The process of creating an empathy map consists of four steps:

- 1. Every team member fills out sticky notes with information related to the four quadrants.*
- 2. You group similar notes and create a name for the new group.*
- 3. You start discussing the findings with your teammates and come up with user needs and potential insights - you can write all of them down on one of the sides of the map.*
- 4. You discuss what knowledge gaps you have and how you can cover them by doing additional user interviews or dairy study, or a product test, etc.*

Let's re-cap:

Please remember to create one empathy map for one user persona.

You can use the following tools to create an empathy map:

- *Miro*
- *Mural*
- *InVision Freehand tool*
